

1 Steam Collection

2 Introduction

Steam Collection is a website designed to display steam game content and information. Users can view the list of all games or direct a search towards what they are looking for. There are different pages for genres, categories and developers as well as an extremely useful search feature built into the game list display page where different queries can be combined filter out results. Game pages include banner art, a brief overview of the game, multiple in-game screenshots, a detailed description, price, genres, developers and categories. Data is loaded in through JSON files stored locally and displayed retrieved dynamically according to each request. This data can be accessed directly using queries with the API built into the website.

The landing page for the site has a fullscreen background image that matches the colour scheme of the website. It provides a quick and easy way for the user to choose how they want to explore the website instead of jumping straight into a certain feature.
